Web Scraping Project

The idea of this project is to practice and play with web scraping capabilities without getting to in-depth.

I found this fake site that allows me to scrape a basic web site for job posting data.

```python
In [1]:  # Import packages to use for web scraping as well as data exploration.

         import requests
         from bs4 import BeautifulSoup
         import pandas as pd
         import numpy as np
```

```python
In [2]:  # Pulling all the data from the website
         response = requests.get("https://realpython.github.io/fake-jobs/")
```

```python
In [3]:  # Showing the data as 'text'
         soup = BeautifulSoup(response.text)
```

```python
In [4]:  print(soup.get_text())
```

This was a straight forward project learning how to scrape a basic website and then put that data into a dataframe that can be visualized and used later for data exploration if needed. We could possibly find the statistics of how many jobs are of different field types (ie. computer, sales, healthcare, etc...) or how many jobs are located in which cities.

We could further explore this data by possibly combining it with data of average salary per job title by scraping data from a site such as 'glass door' that shows some salary information for specific jobs.
